Georgia State University

Spring 2021

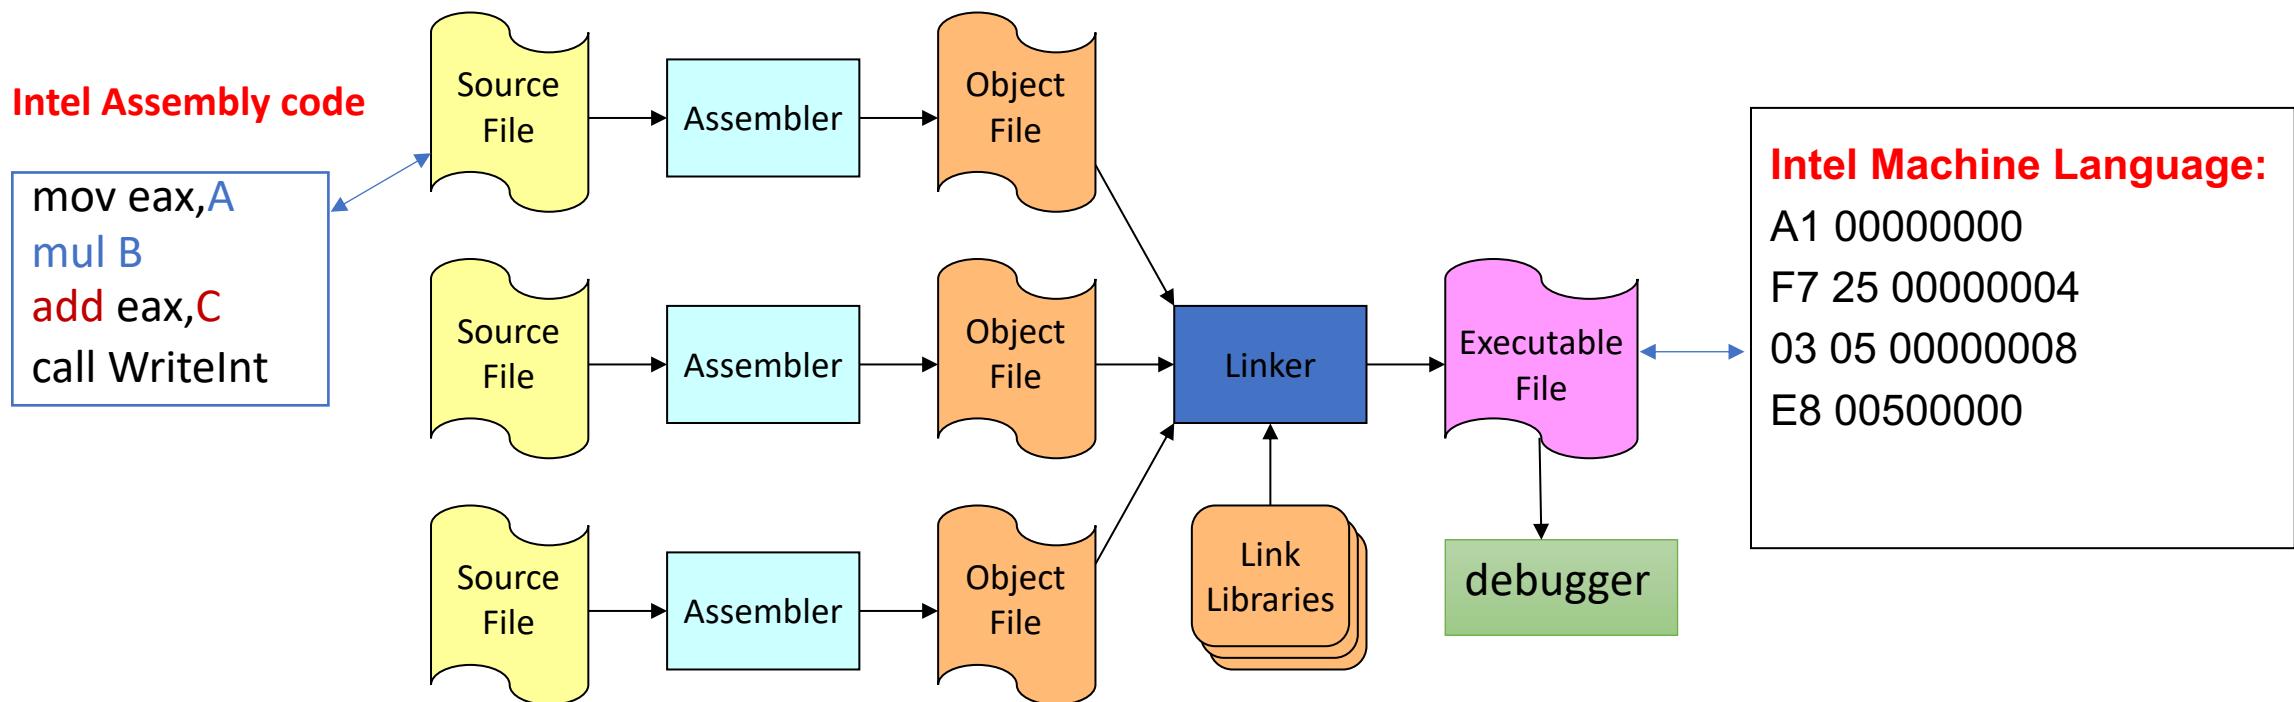

# Outline

- Welcome to Assembly Language
  - Some concerns
  - Applications
- Virtual Machine Concepts
  - Virtual Machines
  - Machine Levels
  - Translating Language
- Data Representation
- Boolean Operations

# Welcome to Assembly language!

Programming is fun!

# What is an assembler, a linker, a debugger?

# Some issues

- What **hardware/software** do I need?
  - Computer 32/64 bit
  - Windows + Microsoft Visual Studio
  - Mac + Virtualization software (Virtualbox) + Windows + Microsoft Visual Studio
- What **types of programs** will I create?
  - Mainly **32-Bit**, Some 64 bit
- What do I get with this book?
  - <http://www.asmirvine.com/>

# More issues

- How does **assembly language** (AL) relate to **machine language**?
  - One-to-one relationship
- How do **C/C++** relates to **AL**?

C/C++

```
int Y;  
int X = (Y + 4) * 3;
```

Assembly

mov eax,Y ;	- move Y to the EAX register
add eax,4 ;	- add 4 to the EAX register
mov ebx,3 ;	- move 3 to the EBX register
imul ebx ;	- multiply EAX by EBX
mov X,eax ;	- move EAX to X

- Is **AL** portable? No. Why?

# Assembly Language Applications

- Some representative types of applications:
  - Hardware device driver
  - Embedded systems & computer games
  - Business application for single platform (No)
  - Business application for multiple platforms (No)

# Think again!

Is the assembly language for x86 processors the same as those for computer systems such as the Vax, Motorola 68x00, or SPARC?

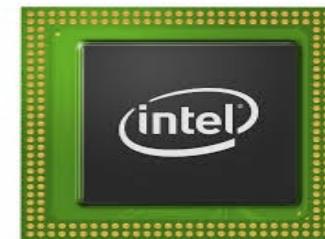

## SPARC

```
mov 5,r1  
mov 6,r2  
add r1,r2,r3
```

## Intel

```
mov eax,5  
add eax,6
```

# What's Next

- - Welcome to Assembly Language
  - Some Good Questions to Ask
  - Assembly Language Applications
- - **Virtual Machine Concept**
  - Virtual Machines
  - Specific Machine Levels
  - Translating Languages
- - Data Representation
- - Boolean Operations

# Virtual Machine Concepts

Abstraction that hides all the low level complexities

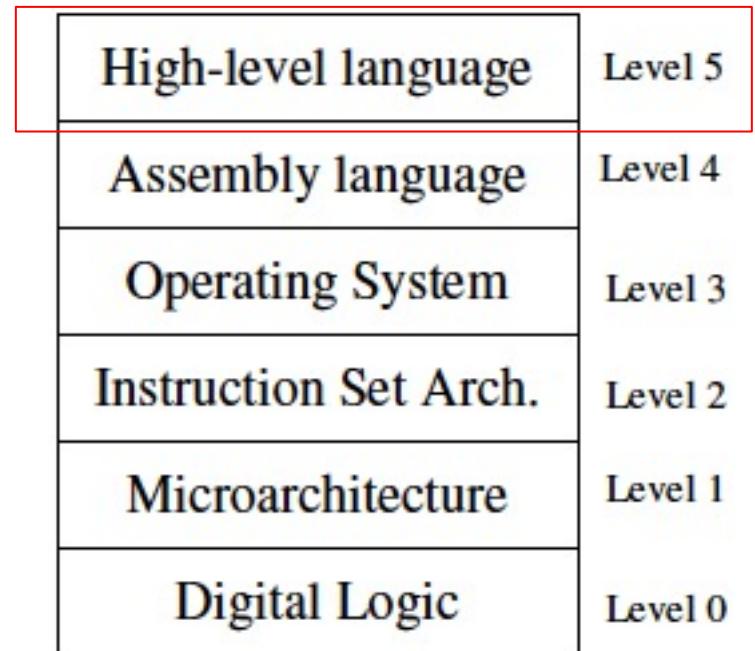

# Specific Machine Levels

- **Virtual Machine Concept**
  - Explain how a computer's hardware and software are related.
  - The main thing a computer does is executing programs
  - A computer execute programs written in its **native machine language (ML)**.
    - difficult to write programs in ML
      - What to do?
    - programs could be written in another language  
(Interpretation vs. Translation)

High-level language	Level 5
Assembly language	Level 4
Operating System	Level 3
Instruction Set Arch.	Level 2
Microarchitecture	Level 1
Digital Logic	Level 0

# Specific Machine Levels: High-Level Language

- **Level 5**
- Application-oriented languages
  - C++, Java, Visual Basic . . .
- Programs compile into assembly language (Level 4)

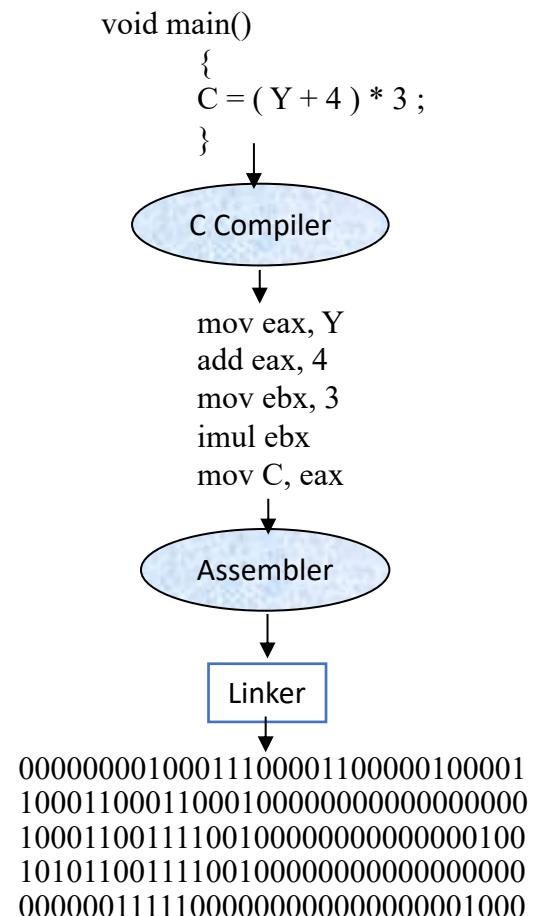

# Specific Machine Levels: High-Level Language

## *High-level language program (in C)*

## *Assembly language program*

## *Binary machine language program*

High-level language	Level 5
Assembly language	Level 4
Operating System	Level 3
Instruction Set Arch.	Level 2
Microarchitecture	Level 1
Digital Logic	Level 0

# What's Next

- - Welcome to Assembly Language
  - Some Good Questions to Ask
  - Assembly Language Applications
- - **Virtual Machine Concept**
  - Virtual Machines
  - Specific Machine Levels
  - Translating Languages
- - **Data Representation**
- - Boolean Operations

# Data Representation

Lots of math!

# Data Representation

- **Binary Numbers**
  - Translating between binary and decimal
- **Binary Addition**
- Integer Storage Sizes
- **Hexadecimal Integers**
  - Translating between decimal and hexadecimal
  - Hexadecimal subtraction
- **Signed Integers**
  - Binary subtraction
- **Character Storage**

# Data Representation: Numbering System

- Assembly language deals with **Data at the physical level**
  - so you need to examine registers and memory
- Binary and hexadecimal numbers are commonly used to describe those contents (other systems used as well)
- **Need to learn how to translate from one format to another**

Table 1-2 Binary, Octal, Decimal, and Hexadecimal Digits.

System	Base	Possible Digits
Binary	2	0 1
Octal	8	0 1 2 3 4 5 6 7
Decimal	10	0 1 2 3 4 5 6 7 8 9
Hexadecimal	16	0 1 2 3 4 5 6 7 8 9 A B C D E F

Base: maximum number of symbols assigned to every digit

<u>Number System</u>				
<u>Bin</u>	<u>Decimal</u>	<u>Octal</u>	<u>Hex</u>	
0	0	0	0	11
1	1	1	1	12
10	2	2	2	13
11	3	3	3	14
100	4	4	4	15
101	5	5	5	16
1000	6	6	6	17
1001	7	7	7	18
10000	8	10	8	19
10011	9	11	9	1A
10100	10	12	A	1B
10101	11	13	B	1C
10110	12	14	C	1D
10111	13	15	D	1E
11000	14	16	E	1F
11001	15	17	F	20
11111	20	20	10	18
100000				

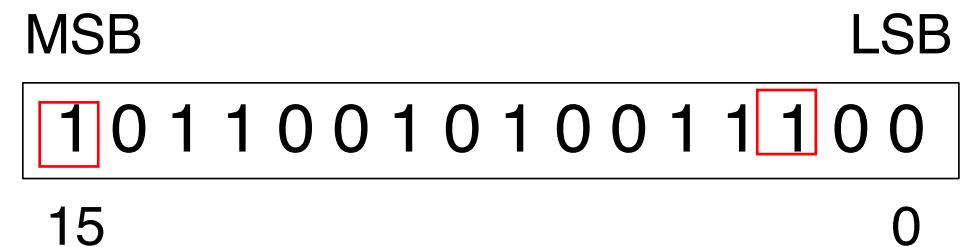

# Data Representation: Binary Numbers (**Integers**)

- Binary integers can be **signed** or **unsigned**.
  - A **signed** integer is **positive** or **negative**.
  - An **unsigned** integer is by default **positive**.
    - **Zero** is considered **positive**.

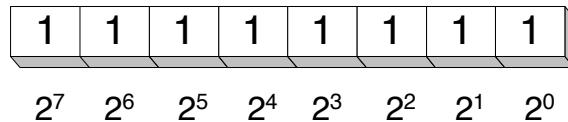

# Data Representation: Binary Numbers (**Integers**)

- Digits are 1 and 0
  - 1 = true
  - 0 = false
- **MSB** – most significant bit
- **LSB** – least significant bit
- **Bit numbering:**

# Data Representation: Binary Numbers (Integers)

- Each digit (bit) is either 1 or 0
- Each bit represents **a power of 2**:

**Table 1-3** Binary Bit Position Values.

$2^n$	Decimal Value	$2^n$	Decimal Value
$2^0$	1	$2^8$	256
$2^1$	2	$2^9$	512
$2^2$	4	$2^{10}$	1024
$2^3$	8	$2^{11}$	2048
$2^4$	16	$2^{12}$	4096
$2^5$	32	$2^{13}$	8192
$2^6$	64	$2^{14}$	16384
$2^7$	128	$2^{15}$	32768

Every binary number is a sum of powers of 2

# Data Representation: Translating Binary to Decimal

- Weighted positional notation shows how to calculate the decimal value of each binary bit:

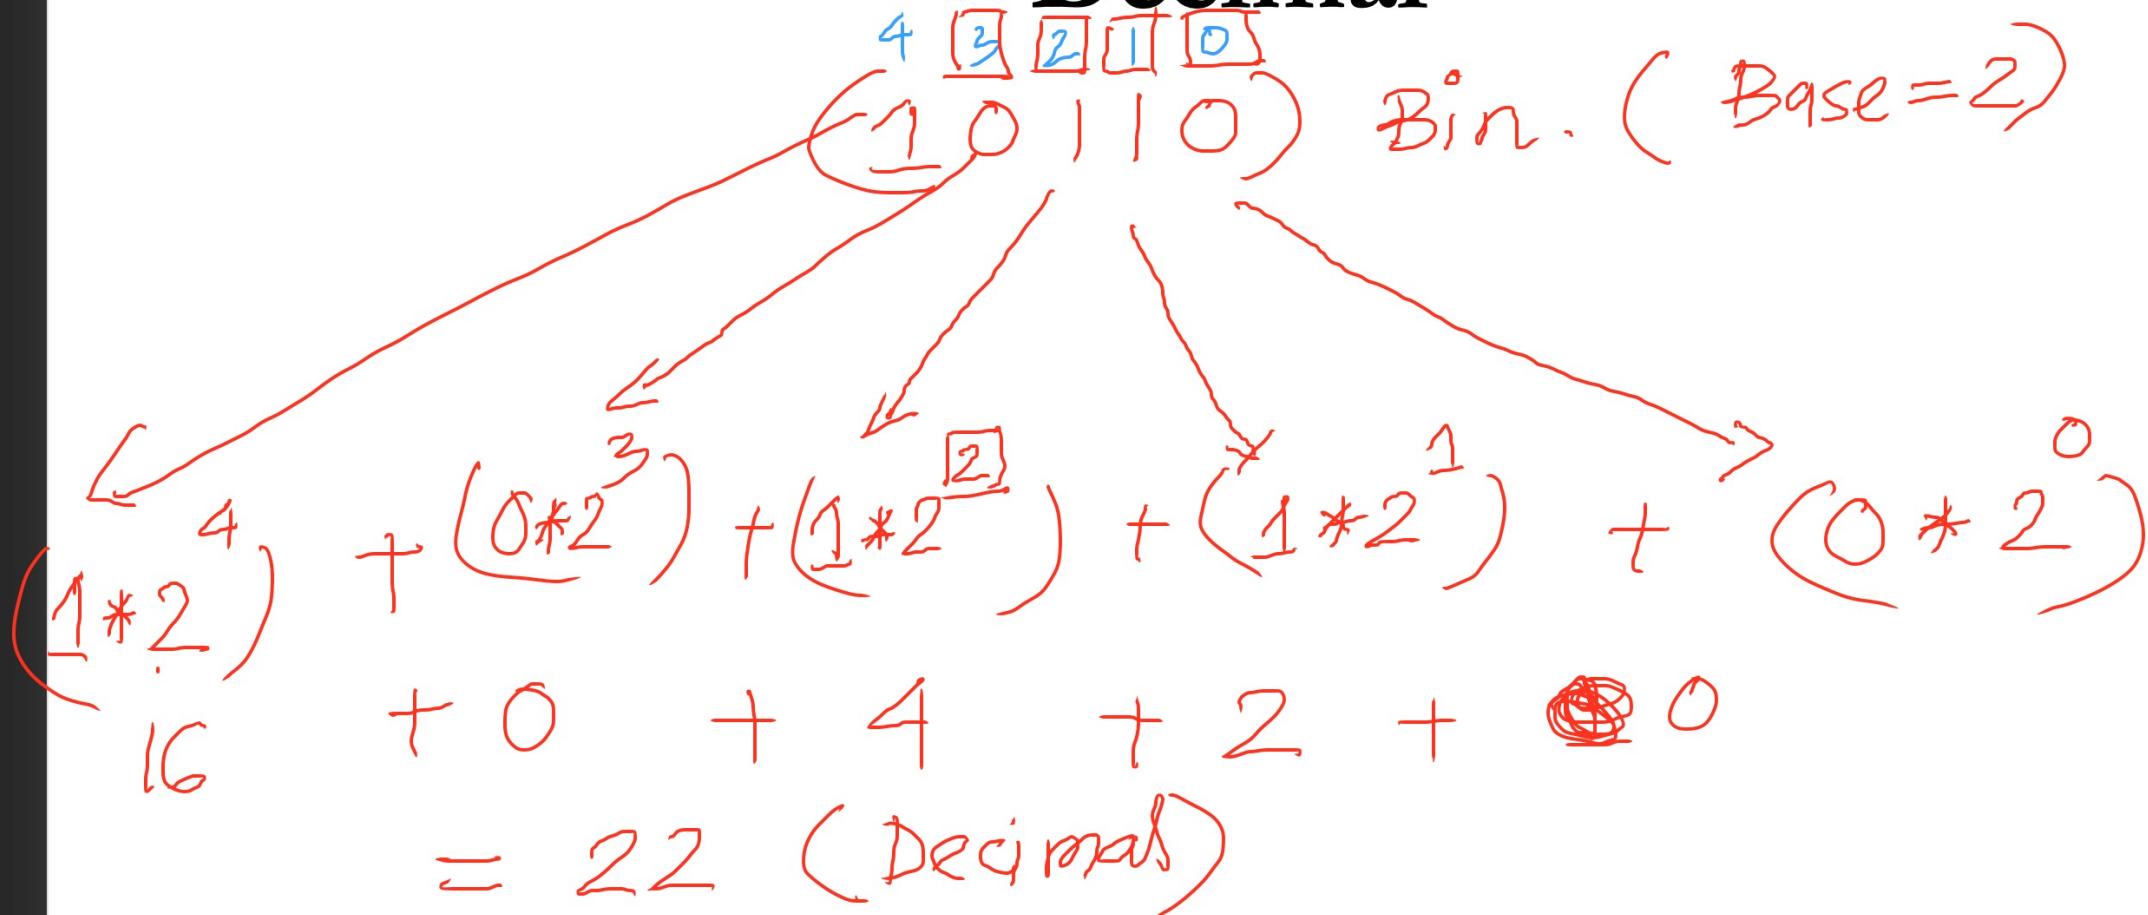

$$dec = (D_{n-1} \times 2^{n-1}) + (D_{n-2} \times 2^{n-2}) + \dots + (D_1 \times 2^1) + (D_0 \times 2^0)$$

D = binary digit

**binary 00001001 = decimal 9:**

$$(1 \times 2^3) + (1 \times 2^0) = 9$$

# Data Representation: Translating Binary to Decimal

4 [3] [2] [1] [0]  
1 0 1 1 0 Bin. (Base=2)

$(1 * 2^4) + (0 * 2^3) + (1 * 2^2) + (1 * 2^1) + (0 * 2^0)$

16 + 0 + 4 + 2 + 0  
= 22 (Decimal)

# Data Representation: Translating Unsigned Decimal to Binary

- Repeatedly divide the decimal integer by 2.
- Each remainder is a binary digit in the translated value:

$$37 = 100101$$

Division	Quotient	Remainder
$37 / 2$	18	1
$18 / 2$	9	0
$9 / 2$	4	1
$4 / 2$	2	0
$2 / 2$	1	0
$1 / 2$	0	1

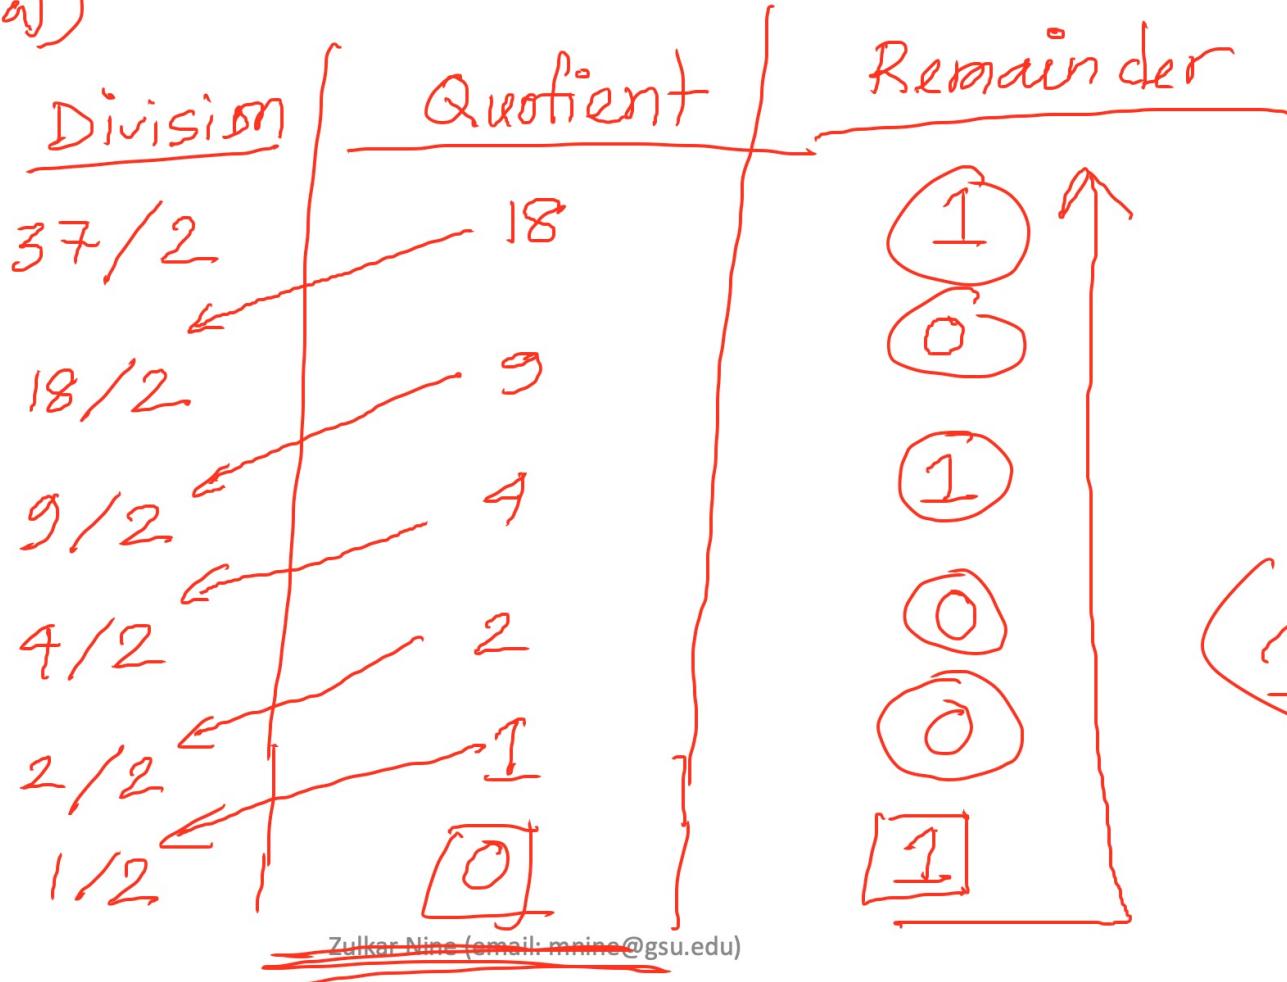

## Decimal to [Binary]

Divide 2

37 (Decimal)

(Stop when Quotient = 0)

1/13/22

(100101) Bin

# Data Representation: Binary Addition

- Starting with the LSB, add each pair of digits,  
**include the carry if present.**

A binary number represented as a sequence of bits: 1011001010011100. The bit at index 0 is labeled 'LSB' (Least Significant Bit) and the bit at index 15 is labeled 'MSB' (Most Significant Bit). The number 15 is written below the bit sequence.

	carry:	1						
0	0	0	0					
+	0	0	0					
<hr/>								
0	0	0	0					
1	0	1	1					
(4)	(7)		(11)					
position:	7	6	5	4	3	2	1	0

# Data Representation: Integer Storage Sizes

- Standard sizes (**x86**):

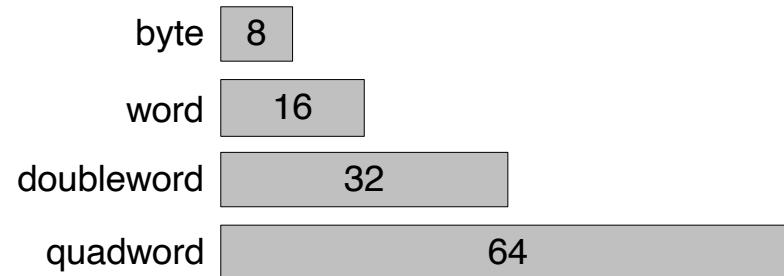

TABLE 1-4 Ranges and Sizes of Unsigned Integer Types.

Type	Range	Storage Size in Bits
Unsigned byte	0 to $2^8 - 1$	8
Unsigned word	0 to $2^{16} - 1$	16
Unsigned doubleword	0 to $2^{32} - 1$	32
Unsigned quadword	0 to $2^{64} - 1$	64
Unsigned double quadword	0 to $2^{128} - 1$	128

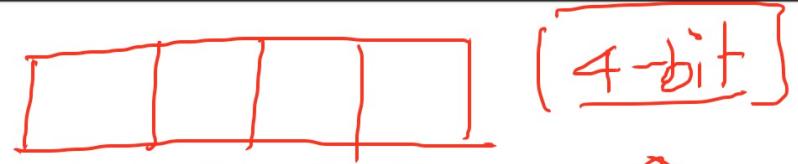

What is the largest unsigned integer that may be stored in 20 bits?

8 bit

$$2^{8-1} = 256$$

~~123-bit~~  
 $(12^3 - 1)$   
2

1/12/22

[4-bit]

0 0 0 0	→ 0
0 0 0 1	→ 1
0 0 1 0	→ 2
0 0 1 1	.
0 1 0 0	.
0 1 0 1	.
0 1 1 0	.
0 1 1 1	.
1 0 0 0	.
1 0 0 1	.
1 0 1 0	.
1 0 1 1	.
1 1 0 0	.
1 1 0 1	.
1 1 1 0	.
1 1 1 1	→ 15

0 to 15  
0 to  $2^4 - 1$

$(2^n - 1)$

# Data Representation: **Hexadecimal** Integers

- Binary values are represented in hexadecimal (Why).
  - Large binary numbers are hard to read

**Table 1-5** Binary, Decimal, and Hexadecimal Equivalents.

Binary	Decimal	Hexadecimal	Binary	Decimal	Hexadecimal
0000	0	0	1000	8	8
0001	1	1	1001	9	9
0010	2	2	1010	10	A
0011	3	3	1011	11	B
0100	4	4	1100	12	C
0101	5	5	1101	13	D
0110	6	6	1110	14	E
0111	7	7	1111	15	F

# Data Representation: Translating Binary to Hexadecimal

- Each hexadecimal digit corresponds to **4 binary bits** (Why?).
- **Example:** Translate the binary integer

00010110101001110010100

to hexadecimal:

**Table 1-5** Binary, Decimal, and Hexadecimal Equivalents.

Binary	Decimal	Hexadecimal	Binary	Decimal	Hexadecimal
0000	0	0	1000	8	8
0001	1	1	1001	9	9
0010	2	2	1010	10	A
0011	3	3	1011	11	B
0100	4	4	1100	12	C
0101	5	5	1101	13	D
0110	6	6	1110	14	E
0111	7	7	1111	15	F

1	6	A	7	9	4
0001	0110	1010	0111	1001	0100

# Data Representation: Converting Hexadecimal to Decimal

- Multiply each digit by its corresponding power of 16:

$$\text{dec} = (D_3 \times 16^3) + (D_2 \times 16^2) + (D_1 \times 16^1) + (D_0 \times 16^0)$$

- Hex 1234 equals  $(1 \times 16^3) + (2 \times 16^2) + (3 \times 16^1) + (4 \times 16^0)$ , or decimal 4,660.
- Hex 3BA4 equals  $(3 \times 16^3) + (11 * 16^2) + (10 \times 16^1) + (4 \times 16^0)$ , or decimal 15,268.

A - 10  
 B - 11  
 C - 12

# Data Representation: Converting Hexadecimal to Decimal

- $\bullet$  (6) ←

(Hex)

$(1 * 16^3) + (3 * 16^2) + (10 * 16^1) + (C * 16^0)$

$=$

Decimal

# Data Representation: Converting Decimal to Hexadecimal

422 Decimal

Division	Quotient	Remainder
$422 / 16$	26	6
$26 / 16$	1	(10)→A
$1 / 16$	0	1

decimal 422 = 1A6 hexadecimal

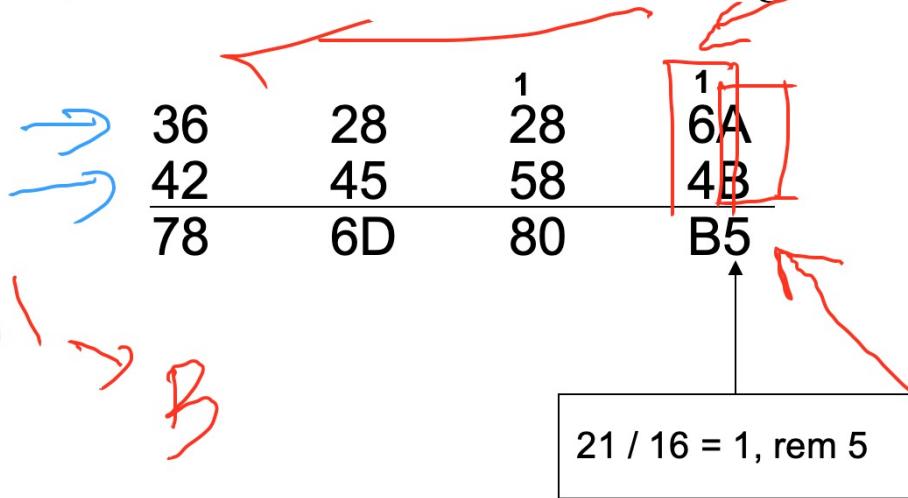

(Stop when Quotient = 0)

(1A6) Hex

# Data Representation: Hexadecimal Addition

*Base 16*

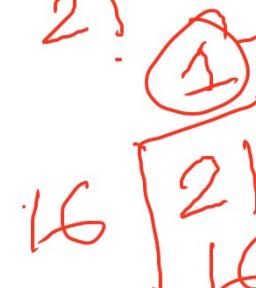

- Divide the sum of two digits by the number base (16). The quotient becomes the carry value, and the remainder is the sum digit.

$$A = 10$$

$$B = 11$$

21

$$1+6+4=11 \rightarrow B$$

$$16 \rightarrow B$$

Important skill: Programmers frequently add and subtract the addresses of variables and instructions.

Decimal

$$\begin{array}{r} 1 \\ + \quad 9 \boxed{6} \\ \hline 3 \end{array}$$

← carry.

$$10 \overline{)13} \quad \begin{array}{l} 1 \leftarrow \text{Result} \\ 10 \\ \hline 3 \leftarrow \text{remainder} \end{array}$$

# Data Representation: **Hexadecimal Subtraction**

- When a borrow is required from the digit to the left, **add 16 (decimal) to the current digit's value:**

$$\begin{array}{r} & \boxed{16 + 5 = 21} \\ & \downarrow \\ \begin{array}{r} 6 \\ -1 \\ \hline 5 \end{array} & \xrightarrow{\quad} \\ \begin{array}{r} C6 \\ A2 \\ \hline 24 \end{array} & \begin{array}{r} 75 \\ - \\ \hline (14) \end{array} \end{array}$$

$$\begin{array}{r} 21 \\ -7 \\ \hline (14) \end{array} \rightarrow E$$

Decimal

$$\begin{array}{r} 10 \\ 15 \\ \hline 18 \\ - \\ 07 \end{array}$$
